                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a mammalian secreted group IIF secreted phospholipase A2 (sPLA2) (1), where the enzyme is Ca2+ dependent, maximally active at pH 7-8 and hydrolyzes phosphatidylglycerol versus phosphatidylcholine with a 15-fold preference. A pharmaceutical composition comprising (1) is useful for treating or preventing viral and bacterial infections, and cancers. A pharmaceutical composition compounds capable of inhibiting catalytic activity of (1), biologically active compounds that bind spLA 2 receptors, or a compound that modulates cell roliferation, cell migration, cell contraction or
                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 KLEKYLFSVSERGIFCAGRITCORLTCECDKRAALCFRRNLGTYNRKYAHYPNKLCTGFT 120

and the gene encoding it. Inhibitors of phospholipase A2 have antibacterial; immunosuppressive; antiinflammatory; tranquilliser; vulnerary; antiathatic, antiantermatic; and antiarthritic activity. The PLA2 protein, gene and an anti-PLA2 antibody are useful in the diagnosis of PLA2 associated diseases e.g. septic shock, adult respiratory distress syndrome, pancreatitis, trauma, bronchial asthma, allergic rhinitis and rheumatoid arthritis. The present sequence represents human PLA2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Group IIF secreted phospholipase A2; sPLA2; phosphatidy1glycerol; human;

apoptosis is useful for treating disease states or disorders involving group IIF sPLA2, such as inflammatory disease, cancers, cardiac and brain scanemia, acute lung injury, acute respiratory distress syndrome or Crohn's disease. Specific antibodies are useful for searching new secreted mammalian group IIF sPLA2 or the homologues of the enzyme in other mammals. The encoding polynucleotides and vectors are useful for transforming animals and establishing a line of transgenic animals. Sequences ABR44322-238 represent various human secreted sPLA2 enzymes used in alignment studies with the GIIF sPLA2 enzyme
                                                                                                                                                                                                                                                                                 ö

             a 15-fold preference. The mammalian secreted group IIF spiaz protein or nucleic acid, or a pharmaceutical composition is useful for treating and/or preventing viral infections, or cancers. The inhibitors of SPIAZ or a composition comprising spiaz inhibitors is unbibitors of sPIAZ or a composition comprising spiaz inhibitors is useful for treating disease states or disorders involving group IIF sPIAZ, e.g. inflammatory diseases, cancer, cardiac and brain ischaemia, acute lung injury, acute respiratory distress syndrome, or Crohn's acute lung injury, acute respiratory distress syndrome, or Crohn's compounds for treating these diseases. This is the amino acid sequence of human group IIE phospholipase A2 used to determine a consensus sequence

                                                                                                                                                                                                                                                                                                                                          91
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a mouse secretory type phospholipase A2 (PLA2) protein. The mouse secretory type PLA2-like protein can be used for screening in the development of inhibitors against the function of the protein. The present sequence represents mouse secretory type PLA2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to human secretory phospholipase A2 (PLA2) protein and the gene encoding it. Inhibitors of phospholipase A2 have antibacterial; immunosuppressive; antiinflammatory; tranquilliser; vulnerary; antiasthmatic; antiallergic; antirheumatic; and antiarthritic activity. The PLA2 protein, gene and an anti-PLA2 antibody are useful in the diagnosis of PLA2 associated diseases e.g. septic shock, adult respiratory distress syndrome, pancreatitis, trauma, bronchial asthma, allergic rhinitis and rheumatoid arthritis. The present sequence represents murine PLA2 gene sequence is used in the invention for the identification and characterisation of the human PLA2

Group IIA PLA2 and an antibiotic. The methods of the invention are useful for killing Gram-positive bacteria, (especially Staphylococcus aureus) and for treating human patient surfering from an infection caused by Gram-positive bacteria. The bacteria are selected from Micrococcus, Staphylococcus, Streptococcus, Peptococcus, Peptostreptococcus, Enterococcus, Methanobacterium, Peptostridium, Lactobacillus, Listeria, Erysipelothrix, Corymbacterium, Propionibacterium, Bacterionema, Rothia, Mycobacterium, Nocardia, Streptomyces and Micropolyspora. The methods are useful for treating potentially life-threatening infection caused by multi-drug resistant Gram positive bacteria, for treating wound and bloodstream infection with methicillin-resistant S. aureus (MRRA) and
                                                                                                                                                                                                                                                 nosocomial infections with vancomycin-resistant Enterococcus faecium. The present sequence represents the I8M/G72K/T103K mutant PLA2 of the Invention. Note: The present sequence is not shown in the specification but was created by the indexer using the information in example 1 and the sequence appearing as ADA61978.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 TKFLSYKFSNSKSRITCAKODSCRSQLCECDKAAATCFARNKKTYNKKYQYYSNKHCRGS 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human spleen was homogenated then centrifuged to obtain a precipitated pellet comprising the cell membrane component. The pellet was extracted with KBr aq. solution. Pure phospholipase A2 was obtained from the crude preparation by a combination of chromatography techniques. The protein

This sequence represents the full length human group II secretory phospholipase A2 (hsPLA2 grII) protein. The invention relates to peptides comprising eleven amino acids, corresponding to residues 51-62 of hsPLA2 grII. The peptides are useful in screening new compounds for their potential use as drugs in the treatment or prevention of coagulation potential use as drugs in the treatment or prevention of coagulation activation in vivo in humans and animals). The peptides and antibodies form compositions in the regulation of the coagulant effect in vivo in humans or animals. The peptides are also useful, in forming kits in the humans or animals. The peptides are also useful, the peptides and antibodies form compositions in the treatment or prevention of haemostatic disorders. The peptide represents the specific region of haemostatic disorders. The peptide represents the specific region of hsPLA2 grII involved in the inhibition of the FVA/FVA complex formation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to killing gram-positive bacteria (I) in human patient, comprising contacting the bacteria with a bactericidal-effective amount of mutant human Group IIA phospholipase A2 (Group IIA PLA2) appearing as ADA61978, or treating a human patient suffering from infection caused by a bacteria comprising administering a mutant human group IIA PLA2 and an antibiotic. The methods of the invention are useful for killing Gram-positive bacteria, (especially Staphylococcus aureus) and for treating human patient suffering from an infection caused by Gram

positive bacteria. The bacteria are selected from Micrococcus, Staphylococcus, Streptococcus, Peptoaccus, Peptostreptococcus, Enterococcus, Enterococcus, Methanobacterium, Bacillus, Clostridium, Lactobacillus, Listeria, Erysipelothrix, Corynebacterium, Propionibacterium, Eutococcus, Methanopees, Arachnia, Bifidobacterium, Bacterionema, Bothia, Mycobacterium, Nocardia, Streptomyces and Micropolyspora. The methods are useful for treating potentially life-threatening infection caused by multi-drug resistant Gram positive bacteria, for treating wound and bloodstream infection with methicillin-resistant S. aureus (MRSA) and nosocomial infections with vancomycin-resistant Enterococcus faecium. The present sequence represents the Aracomycin-resistant Enterococcus faecium. The present sequence is not shown in the specification but was created by the indexer using the information in example 1 and the sequence appearing

The invention relates to killing gram-positive bacteria (I) in human patient, comprising contacting the bacteria with a bactericidal-effective amount of mutant human group IIA phospholipase A2 (Group IIA PLA2) appearing as ADA61978, or treating a human patient suffering from infection caused by a bacteria comprising administering a mutant human for properting and an antibiotic. The methods of the invention are useful for killing Gram-positive bacteria. Suffering from an infection caused by Gram footier are selected from Micrococcus,
                                                                                                                                                                                                                                                                      Staphylococcus, Streptococcus, Peptococcus, Enterococcus, Enterococcus, Straptococcus, Peptococcus, Enterococcus, Methanobacterium, Bacillus, Clostridium, Lactobacillus, Listeria, Erysipelothrix, Corynebacterium, Propionibacterium, Bacterionema, Bubacterium, Actinomyces, Arachnia, Bifidobacterium, Bacterionema, Rothia, Mycobacterium, Nocardia, Streptomyces and Micropolyspora. The methods are useful for treating potentially life-threatening infection and bloodstream infection with methicillin-resistant S. aureus (MRSA) and nosocomial infections with vancomycin-resistant Enterococcus faecium. The present sequence represents the G72K/T103K mutant PLA2 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 TKFLSYKFSNSKSRITCAKQDSCRSQLCECDKAAATCFARNKKTYNKKYQYYSNKHCRGS 120

The present invention describes a fusion polypeptide (I) for expression in a host cell comprising a TolAIII domain (functional homologue, fragment or derivative), and a non-TolA polypeptide, where the TolAIII domain (functional homologue, fragment or derivative) is located towards to chart of the fusion polypeptide, where the TolAIII contains of the fusion polypeptide, and the non-TolA polypeptide is located towards the C-terminus of the fusion polypeptide (I); (2) an corression vector (III) encoding the fusion polypeptide (I); (2) an expression vector (III) comprising (II) for expression of (I); (2) an containt of the TolAIII domain (functional homologue, fragment or comprising the TolAIII domain (functional homologue, fragment or derivative) upstream or downstream from a cloning site which allows incompanies in service of I), and/or (III), and/or (III), and/or (III), and/or (III) or containt of the TolAIII domain (functional homologue, fragment or derivative) is useful for producing the fusion polypeptide (I), band molecule (II), expression vector (III) or containt and properties of the non-TolA polypeptide, or studying interaction properties of the non-TolA polypeptide, or studying interaction properties of the non-TolA polypeptide or the fusion polypeptide as a fusion polypeptide in a host cell. 1. .14

```
The protein sequence was deduced from a DNA sequence obtd. from a genomic DNA library which was prepd. from a mutant fibroblast cell line which contains 5 copies of the X chromesome (GM5009). The signal sequence is thought to be incomplete at the N-terminal since no promoter-like sequences are found in the DNA within 100 nucleo-tides 5' of this region. The deduced N-terminal sequence of the mature protein confirmed results obtd. by direct sequencing of the purified protein. This sequence for the mature protein confirmed results obtd. by direct sequencing of the purified protein. This sequence of the purified protein. This sequence (29) and there is a cluster of basic amino acids [e.g. Arg (27), Lys highly conserved lipophilic residues [e.g. Leu (22)] Pla (25), and Ile (29) and there is a cluster of basic amino acids [e.g. Arg (27), Lys (30) and high is believed to be an important determinant in the interaction of Full 2. There is a characteristic stretch of residues which comprises part of the calcium binding loop: Tyr(44)-Gly-Cys-X-Cys-Gly-Cys-X-X-X-Pro(56) and Asp(68). The conserved residues which constitute the active site (see features) are also present, and the protein exhibits the placement of half-cysteine residues typical of a Gp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        60 PKLEKYLFSVSERGIFCAGRTTCQRLTCECDKRAALCFRRNLGTYNRKYAHYPNKLCTGP 119

This sequence is encoded by the phospholipase A2 (PLA2) cDNA. The cDNA was amplified using the primer sequences given in AAQ26370-1 by PCR from a human lung cDNA library. The cDNA sequence was used in the construction of an expression vector which further comprised a promoter and a dominant control region. This vector was used in an expression system comprising a mammalian cell transformed with the vector. This expression system could be used to prepare pharmacologically useful polypeptides eg, human growth hormone (HGH), granulocyte-colony stimulating factor (G-CSF) and PLA2, and for gene therapy. The mammalian host comprises erythroid cells and a heterologous promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               60 PKLEKYLFSVSERGIFCAGRITCQRLTCECDKRAALCFRRNLGTYNRKYAHYPNKLCTGP 119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mammalian synovial phospholipase A2 - used in food processing, design and screening of inflammation inhibitors, as an anticancer drug or vaccine adjuvant etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Clone lambda SPiA2cDNA-4 is one of four clones identified when probe oligo 2905 (AAN91257) was used to screen a cDNA library constructed from polyA+ message from a peritoneal cell RNA. It encodes the entire sPLA2 type A sequence which is given here. The mature peptide sequence (see FT) has a calculated molecular weight of 13,919 daltons. The same amino acid sequence is also encoded by the exons of clone lambda SPLA2-6 (AAN91260) in Figure 7. (Updated on 25-MAR-2003 to correct PR field.) *Novel type III and IV low mol. wt. phospholipase A2 enzymes - from humans and rats, also nucleic acid sequences useful, e.g. for recombinant prodn. of enzymes, research into Batten's disease, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A human cDNA (AAQ81138) expressing a novel PLA2, HPLA2-10, was derived from human brain RNA by RACE-PCR. HPLA2-10 (AAR63346) was characterized as a novel type of PLA2, type IV, on the basis of its Cys content in comparison with human PLA2 types I (AAR63054) and II (AAR63055) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Batent No. 6352849

GENERAL INFORMATION:

APPLICANT: Tischfield, Jay A.

APPLICANT: Seilhamer, Jeffrey J.

TITLE OF INVENTION: Mammalian Phospholipase A2 Nucleotide

TITLE OF INVENTION: Sequences and Low Molecular Weight Amino Acid Sequences

TITLE OF INVENTION: Sequences Having Internal Ribosome Binding Sites

NUMBER OF SEQUENCES:

ADDRESSEE: Riden, Barnett, McClosky, Smith, Schuster &

ADDRESSEE: Russell PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              65 VTHDCCYKRLEKRGCGTKFLSYKFSNSGSRITCAKQDSCRSQLCECDKAAATCFARNKTT 124

GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Rischfield, Jay A.
APPLICANT: Seilhamer, Jeffrey J.
TITLE OF INVENTION: Mammalian Phospholipase A2 Nucleotide
TITLE OF INVENTION: Sequences and Low Molecular Weight Amino Acid Sequences
TITLE OF INVENTION: Sequences Having Internal Ribosome Binding Sites
NUMBER OF SEQUENCES: 44
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           79 PKLEKYLFSVSERGIFCAGRITCORLICECDKRAALCFRRNLGIYNRKYAHYPNKLCTGP 138

Sequence 39, Application US/0936230

Retent No. 6322849

GENERAL INFORMATION:

APPLICANT: Tischfield, Jay A.

TITLE OF INVENTION: Mammalian Phospholipase A2 Nucleotide

TITLE OF INVENTION: Sequences and Low Molecular Weight Amino Acid Sequences

TITLE OF INVENTION: Sequences Having Internal Ribosome Binding Sites

NUMBER OF SEQUENCES: 44

CORRESPONDENCE ADDRESS: And Antisense Sequences and Nucleotide

STATE: Ruden, Barnett, McClosky, Smith, Schuster & STREET: 200 East Broward Boulevard

CITY: Fort Lauderdale

STREET: 200 East Broward Boulevard

CITY: Fort Lauderdale
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 TKFLSYKFSNSGSRITCAKQDSCRSQLCECDKAAATCFARNKTTYNKKYQYYSNKHCRGS 120

GENERAL INFORMATION:
APPLICANT: Tischfield, Jay A.
APPLICANT: Seilhamer, Jeffrey J.
APPLICANT: Seilhamer, Jeffrey J.
TITLE OF INVENTION: Mammalian Phospholipase A2 Nucleotide
TITLE OF INVENTION: Sequences and Low Molecular Weight Amino Acid Sequences
TITLE OF INVENTION: Encoded Thereby, Antisense Sequences and Nucleotide
TITLE OF INVENTION: Sequences Having Internal Ribosome Binding Sites
NUMBER OF SEQUENCES: 44

"Structures, enzymatic properties, and expression of novel human and
muse secretory phospholipse A(2)";
J. Biol. Chem. 275:5785-5793(2000)
-!- FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-
--- TALYTIC ACTIVIT: Phosphostholine + H(2)O = 1-
acylg groups in 3-sn-phosphostholine + H(2)O = 1-
acylg groups in 3-sn-phosphostholine + a fatty acid anion.
-!- COFACTOR: Binds I calcium ion per subunit.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Highly expressed in uterus, and at lower
                                                                                                                                                                                                                                                                                 1 MKSPHVLVFLCLLVALVTGNLVQFGVMIEKMTGKSALQYNDYGCYCGIGGSHWPVDQTDW
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           28-FEB-2003 (Rel. 41, Last sequence update)
10-CT-2003 (Rel. 42, Last annotation update)
Group IIE secretory phospholipase A2 precursor (EC 3.1.1.4)
(Phosphatidylcholine 2-acylhydrolase GIIE) (GIIE sPLA2) (sPLA2)

                                                                                                                                                                                                                                                                                                   -:-FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-sn-phosphoglycerides.
-:-CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-acylglycerophosphocholine + a fatty acid anion.
-:-COFACTOR: Binds 1 calcium ion per subunit (By similarity).
-:-SUBCELLULAR LOCATION: Secreted.
-:-SUMCALLULAR Belongs to the phospholipase A2 family. Group II
                                                                                                                   "Amino acid and cDNA sequences of a neutral phospholipase A2 from the long-nosed viper (Vipera ammodytes ammodytes) venom."; Eur. J. Biochem. 204:1057-1062(1992).
                                                                                                                                                                                                                                             Kordis D., Gubensek F., "Molecular evolution of phospholipase A2 multigene family in Vipera ammodytes.", Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.

      FUNCTION: Thought to participate in the regulation of the phospholipid metabolism in biomembranes including eicosanoid alosynthesis. Catalyzes the calcium-dependent hydrolysis of the losynthesis. Catalyzes the calcium-dependent hydrolysis of the losynthesis. Catalyzes the calcium-dependent hydrolysis of the losynthic activity. Phosphatidylcholine + H(2)O = 1- acylglycerophosphocholine + a fatty acid anion. COFACTOR: Binds I calcium ion per subunit. SUBCELLULAR LOCATION: Membrane-associated. MISCELLAREQUS: Group II phospholipase A2 is found in many cells and also extracellularly. The membrane-bound and secreted forms are identical and are encoded by a single gene. SIMILARITY: Belongs to the phospholipase A2 family.
                                                                                                                                                                                                                                                                                                                                                                                                       PHOSPHOLIPASE AŻ, MEMBRANE ASSOCIATED.
BY SIMILARITY.
